

## Kaltiot Smart Tracker

### Locate your things smartly

**Indoor & outdoor positioning** wherever you are. No base stations needed, just utilize your staff smart phones as a “scanner” for Bluetooth beacons. You can use your custom floorplan - works even on multiple floors. With geofencing you can track your *things* smartly.

**Shared view** saves your time because your staff is collecting data from beacons while moving around. The data can be shared within organization, or to other organizations - your co-workers or partners receive the information immediately.

**Multivendor beacon support** allows you to select cost-efficient beacons for your different needs. All iBeacon and Eddystone beacons are supported for tracking purposes – no vendor lock.

**Active mode** is useful feature when you need to find your lost assets. You can use Smart Tracker as active BLE scanner to see all nearby devices.

**Proven scalability** due to utilizing Kaltiot Smart IoT which is already used in millions of devices.

**Data logging** allows collecting sensor data in local buffer. Whenever Smart Tracker application is near, the collected data is transferred to cloud.

**Active dashboard** is ready-made set of monitoring tools which allows custom views of history data and events.

**Easy integration** by using Client SDK and Cloud API
